

Photoshop Action Script Installation and Manual

www.UnstoppablePLR.com

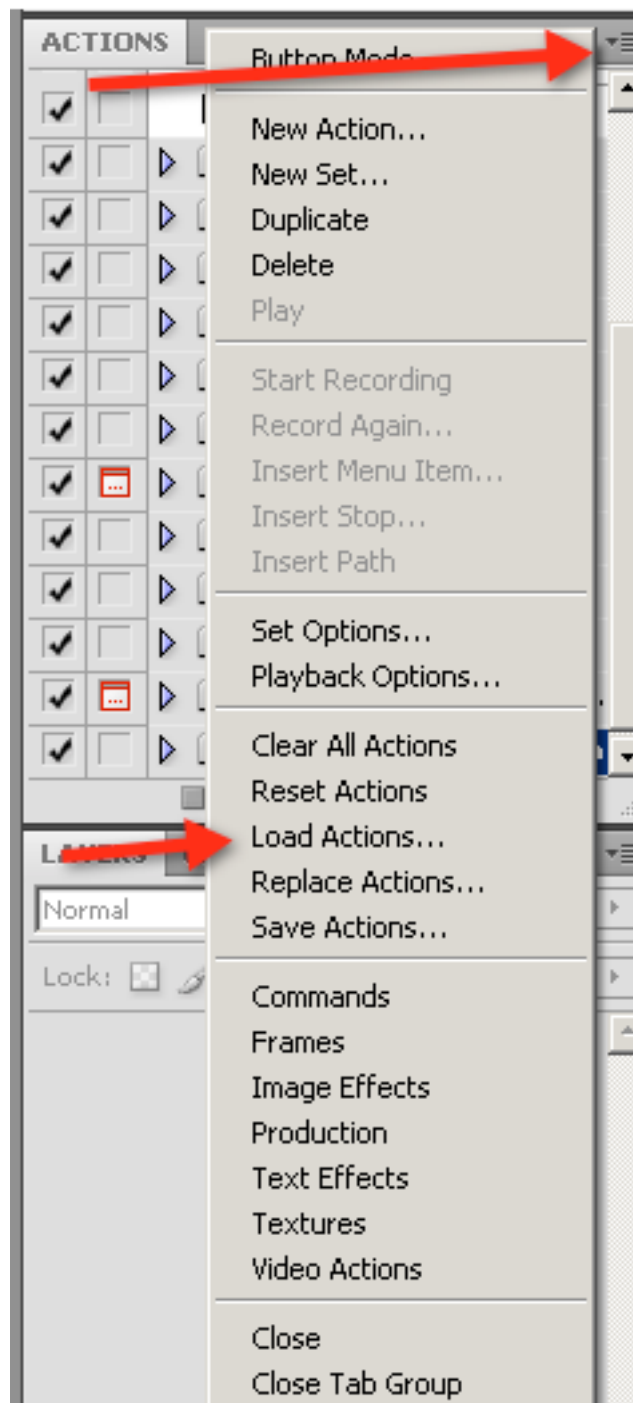

By Aurelius Tjin

Step 1) Load the action script. You're only required to install the action script once.

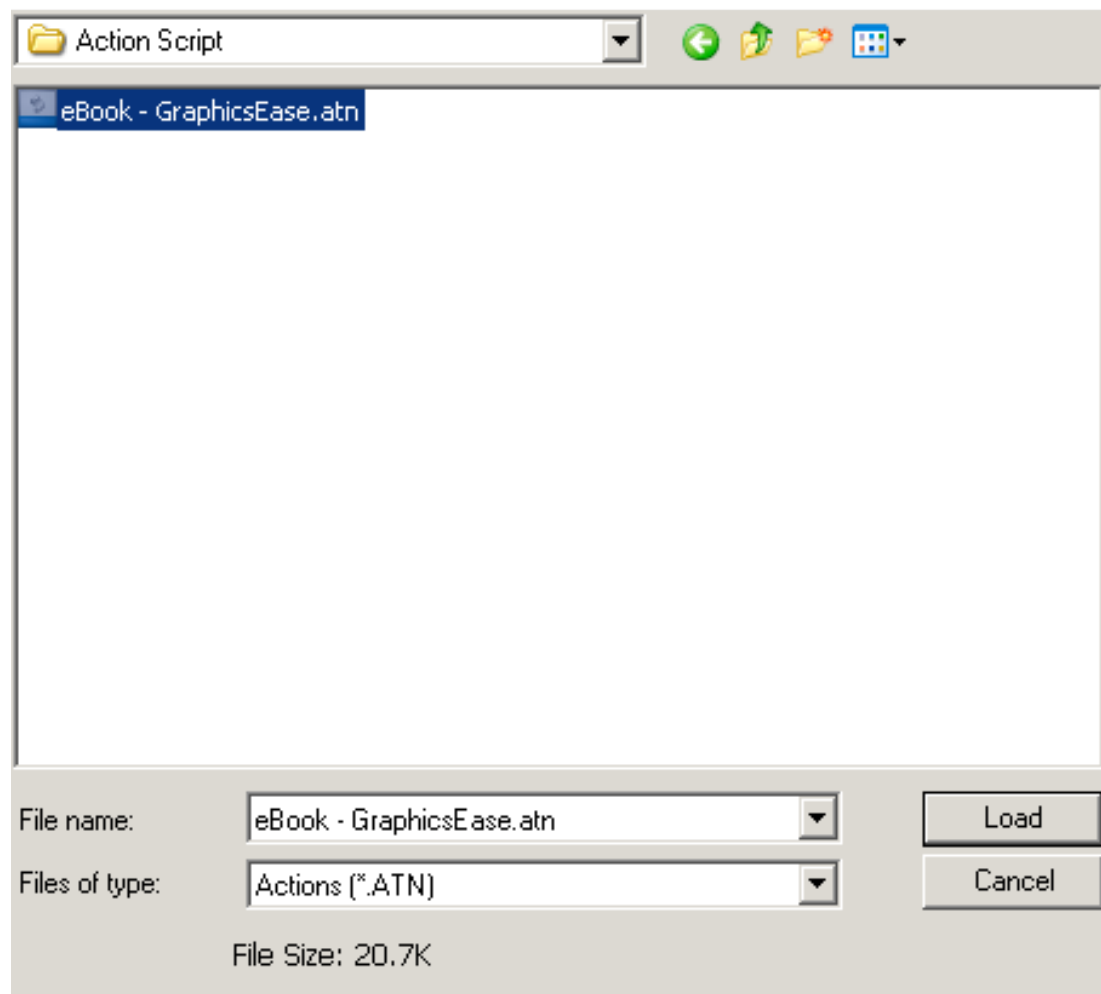

Make sure you have Photoshop opened. On the right side you'll see a window called Actions. If you don't see this window, click on Window from the top bar and make sure 'Actions' is checked:

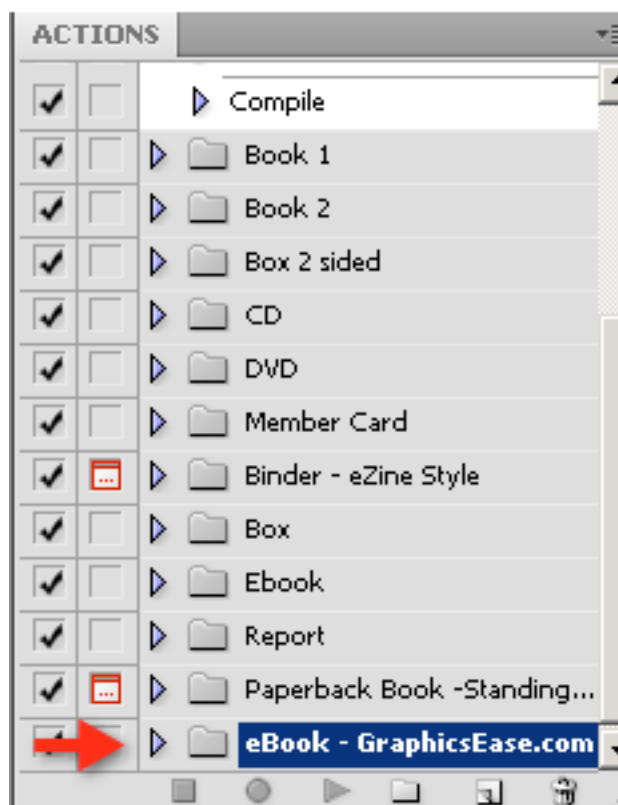

Step 2) Load the action script by clicking on the small button as shown in the screenshot below, and then select Load Actions. Alternatively, you can simply double click the action script file to install it.

Step 3) Locate the action script file and click Load.

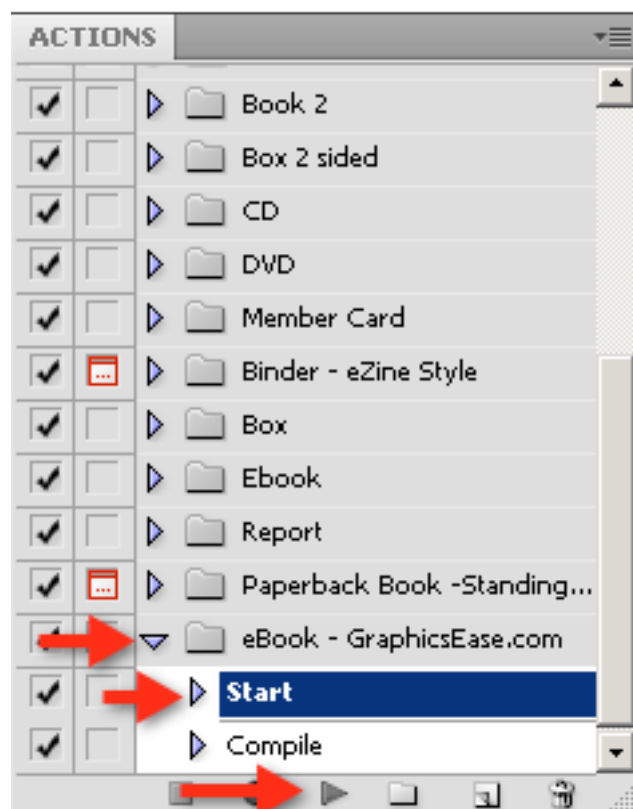

You'll now see the new action script installed in the Actions window, as shown below:

Note: the name of the action script might be different depending where you downloaded it from.

If you have an existing template, skip this step 4.

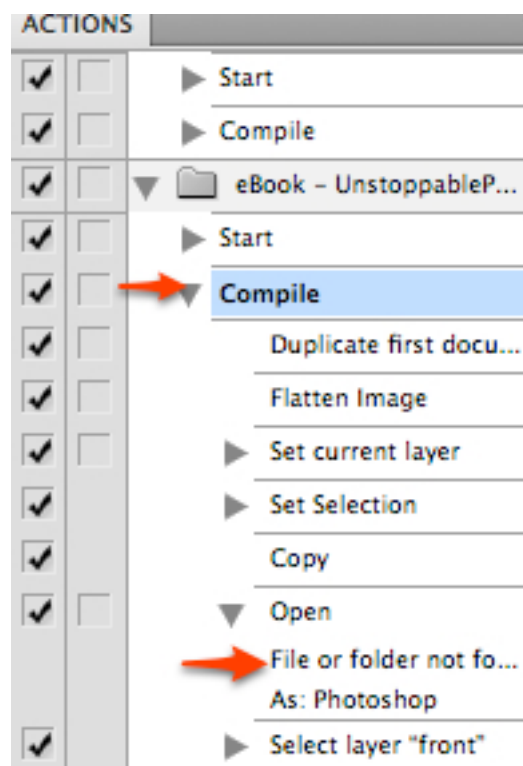

Step 4) To start a new eBook cover, follow the image below:

The template should then load and you can start editing.

Step 5) You'll need to correct the Template file. Click the drop-down arrow in the Compile menu. Then find 'Open'. You'll see 'File or Folder not found'.

Double click that.

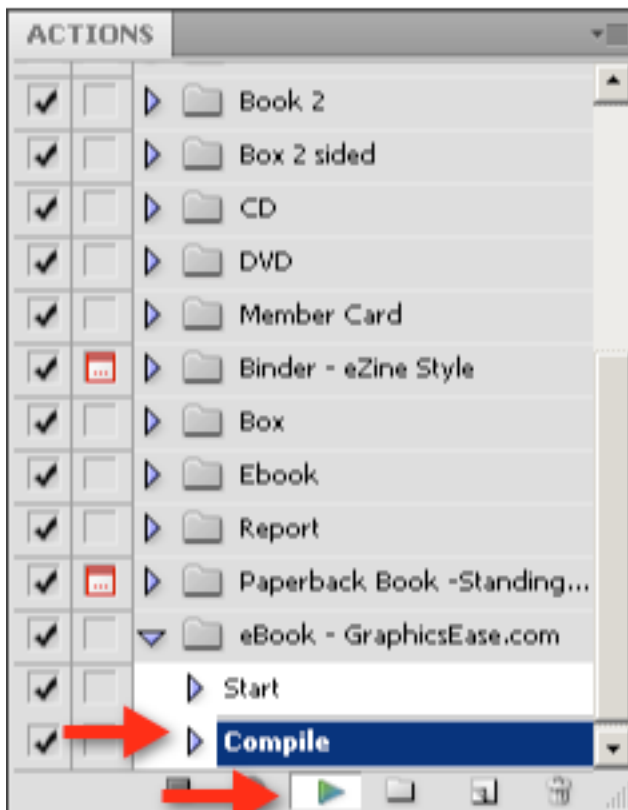

Step 6) You'll see a window where it ask where the template file it. Locate the Template file I.e. – the eBook Template.psd file. TIP: It's a good idea to place the eBook Template.psd file somewhere permanently rather than having it inside your PLR product's folder.

Once that's done, you're ready to use the Compile function.

Compiling Your eBook

When you're finished editing your cover, you can compile the flat eCover into a 3D cover by click the 'Compile' option then the Play button:

During the compiling process, do not open other files in Photoshop.

That's it!

Enjoy creating as many ebook covers as you want!
